Cotton Varieties Planted, United States
1966-1970

Estimates of the percentages of the various varieties of cotton planted in the United States in 1970, by counties, Smith-Doxey cotton classing office territories and states are presented in this report. Comparative variety data for the four years 1966-1969 are shown by states. The variety data presented herein are based primarily on estimates furnished by cotton ginner for the territories served by their gins. Supplemental information is obtained from others closely related with cotton farming in their respective areas, such as seed breeders, seed dealers, farmers and county agents. These estimates should serve as reliable guides as to the geographic distribution of various varieties grown throughout the Cotton Belt.

Nearly three-fourths of the cotton acreage in the United States this season is planted to four general varieties - Deltapine, Stoneville, Acala and Lankart. A percentage distribution of the six leading general varieties planted in 1970, with comparisons for the four preceding years, is shown at the foot of this page. All strains of each particular variety are combined for the purpose of this comparison.

Deltapine continues as the leading variety of cotton planted in the United States for the second consecutive year, accounting for 28 percent of the total 1970 acreage. This compares with 26 percent a year earlier and 19 percent two years ago. Deltapine 16, the most popular strain, accounts for 26 percent of the total acreage this year. Deltapine is the principal variety planted in Alabama, Arizona, Arkansas, Louisiana, Mississippi and Tennessee.

Stoneville is the second leading variety of cotton planted this year. Estimates indicate that this variety comprises 21 percent of total acreage against 17 percent last year. Stoneville 213, the leading Stoneville strain, accounts for 16 percent of the total planted acreage. Stoneville is the major variety planted in Missouri and also accounts for sizable acreages in Alabama, Mississippi, Arkansas and Louisiana.

Acala is the third leading variety of cotton planted this year with 15 percent of the total acreage compared with 17 percent a year earlier. The predominating Acala strain, Acala SJ-1, comprises 11 percent of the total planted acreage. Acala continues to be the principal variety planted in California and New Mexico.

Lankart continues as the fourth leading variety for the fourth consecutive year. Estimates indicate that nine percent of the total acreage is planted to Lankart this year compared with 11 percent a year ago. Lankart 57, the most popular Lankart strain, comprises eight percent of the total acreage. Lankart remains the most favored variety in Texas and Oklahoma.

Coker and Paymaster are the next two leading varieties, accounting for seven and six percent, respectively, of total acreage planted. Coker remains the top choice of farmers in Georgia, North Carolina and South Carolina, and Paymaster is the second leading variety in Texas.

Pima S-4 continues to grow in importance and this year accounts for 80 percent of the total American Pima acreage. This compares with 58 percent a year earlier and 41 percent two years ago. Pima S-4 is the most popular American Pima strain in Texas and Arizona while Pima S-3 remains the most popular strain in New Mexico.

Estimated percentage of cotton acreage planted to specified varieties, United States, 1966-1970

Year	Acala	Coker	Delta- pine	Lankart	Pay- master	Stone- ville	Other 1/	Total
	Pct.	Pct.	Pct.	Pct.	Pct.	Pct.	Pct.	Pct.
1966	13	2	19	13	4	20	29	100
1967	17	5	17	14	5	20	22	100
1968	21	8	19	9	7	21	15	100
1969	17	6	26	11	6	17	17	100
1970	15	7	28	9	6	21	14	100

1/ Includes small acreages planted to varieties other than those specified.

^{1/} Compiled from "Summary of Cotton Fiber and Spinning Test Results, Crop of 1969", USDA, C&MS, Cotton Division, May 1970.

^{2/} Micronaire reading is a measure of fiber fineness and maturity. This test measures resistance of a plug of cotton to air flow.

^{3/} Fiber strength indicates ability of cotton fibers to withstand force or tension, and has a strong bearing on spinning utility. "0" gage fiber strength test made without a spacer between clamp jaws using Pressley flat bundle tester. 1/8" gage strength test made with 1/8" spacer between clamp jaws using Stelometer and results are adjusted to the Pressley level.

^{4/} Digital Fibrograph 2.5% span length indicates length spanned by 2.5 percent of the fibers when they are parallel and randomly distributed. This measure is closely related to staple length designations. Digital Fibrograph 50/2.5 uniformity ratio values indicate relative uniformity of fiber length in samples.
